

DM54LS465/DM74LS465, DM54LS466/DM74LS466, DM54LS467/DM74LS467, DM54LS468/DM74LS468 (DM71LS95A/DM81LS95A, DM71LS96A/DM81LS96A, DM71LS97A/DM81LS97A, DM71LS98A/DM81LS98A) TRI-STATE® Octal Buffers

General Description

These devices provide eight, two-input buffers in each package. All employ the newest low-power-Schottky TTL technology. One of the two inputs to each buffer is used as a control line to gate the output into the high-impedance state, while the other input passes the data through the buffer. The LS465 and LS467 present true data at the outputs, while the LS466 and LS468 are inverting. On the LS465 and LS466 versions, all eight TRI-STATE enable lines are common, with access through a 2-input NOR gate. On the LS467 and LS468 versions, four buffers are enabled from one common line, and the other four buffers are enabled from another common line. In all cases the outputs are placed in the TRI-STATE condition by applying a high logic level to the enable pins. These devices represent octal, low power-Schottky versions of the very popular DM54/74365,

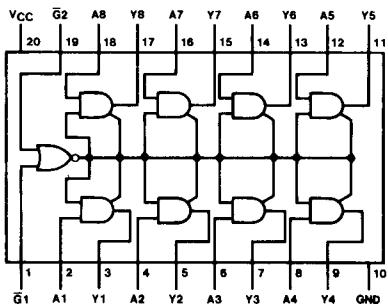

366, 367, and 368 (DM70/8095, 96, 97, and 98) TRI-STATE hex buffers.

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
