

LM124A/LM124QML

Low Power Quad Operational Amplifiers

General Description

The LM124/124A consists of four independent, high gain, internally frequency compensated operational amplifiers which were designed specifically to operate from a single power supply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

Application areas include transducer amplifiers, DC gain blocks and all the conventional op amp circuits which now can be more easily implemented in single power supply systems. For example, the LM124/124A can be directly operated off of the standard +5Vdc power supply voltage which is used in digital systems and will easily provide the required interface electronics without requiring the additional +15Vdc power supplies.

Unique Characteristics

- In the linear mode the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from only a single power supply voltage
- The unity gain cross frequency is temperature compensated
- The input bias current is also temperature compensated

Advantages

- Eliminates need for dual supplies
- Four internally compensated op amps in a single package
- Allows directly sensing near GND and V_{OUT} also goes to GND
- Compatible with all forms of logic
- Power drain suitable for battery operation

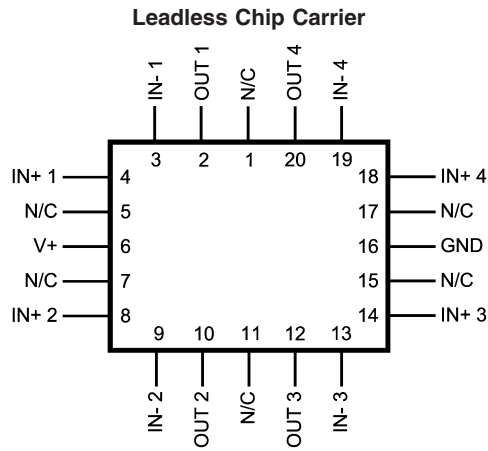

Features

- Internally frequency compensated for unity gain
- Large DC voltage gain 100 dB
- Wide bandwidth (unity gain) 1 MHz (temperature compensated)
- Wide power supply range:
Single supply 3V to 32V
or dual supplies $\pm 1.5V$ to $\pm 16V$
- Very low supply current drain (700 μA)—essentially independent of supply voltage
- Low input biasing current 45 nA (temperature compensated)
- Low input offset voltage 2 mV and offset current: 5 nA
- Input common-mode voltage range includes ground
- Differential input voltage range equal to the power supply voltage
- Large output voltage swing 0V to $V^+ - 1.5V$

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage, V ⁺	32Vdc or +16Vdc
Differential Input Voltage	32Vdc
Input Voltage	-0.3Vdc to +32Vdc
Input Current	
(V _{IN} < -0.3Vdc) (Note 4)	50 mA
Power Dissipation (Note 2)	
CERDIP	1260mW
CERPACK	700mW
LCC	1350mW
CERAMIC SOIC	700mW
Output Short-Circuit to GND	
(One Amplifier) (Note 3)	
V ⁺ ≤ 15Vdc and T _A = 25°C	Continuous
Operating Temperature Range	-55°C ≤ T _A ≤ +125°C
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C ≤ T _A ≤ +150°C
Lead Temperature (Soldering, 10 seconds)	260°C
Thermal Resistance ThetaJA	
CERDIP (Still Air)	103 C/W
(500LF/Min Air flow)	51 C/W
CERPACK (Still Air)	176 C/W
(500LF/Min Air flow)	116 C/W
LCC (Still Air)	91 C/W
(500LF/Min Air flow)	66 C/W
CERAMIC SOIC (Still Air)	176 C/W
(500LF/Min Air flow)	116 C/W
ThetaJC	
CERDIP	19 C/W
CERPACK	18 C/W
LCC	24 C/W
CERAMIC SOIC	18 C/W
Package Weight (Typical)	
CERDIP	TBD
CERPACK	TBD
LCC	TBD
CERAMIC SOIC	410mg
ESD Tolerance (Note 5)	250V

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{jmax} (maximum junction temperature), ThetaJA (package junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is P_{dmax} = (T_{jmax} - T_A)/ThetaJA or the number given in the Absolute Maximum Ratings, whichever is lower.

Note 3: Short circuits from the output to V⁺ can cause excessive heating and eventual destruction. When considering short circuits to ground, the maximum output current is approximately 40mA independent of the magnitude of V⁺. At values of supply voltage in excess of +15Vdc, continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.

Note 4: This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the op amps to go to the V⁺ voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3Vdc (at 25°C).

Note 5: Human body model, 1.5 kΩ in series with 100 pF.

Application Hints

The LM124 series are op amps which operate with only a single power supply voltage, have true-differential inputs, and remain in the linear mode with an input common-mode voltage of 0 V_{DC} . These amplifiers operate over a wide range of power supply voltage with little change in performance characteristics. At 25°C amplifier operation is possible down to a minimum supply voltage of 2.3 V_{DC} .

The pinouts of the package have been designed to simplify PC board layouts. Inverting inputs are adjacent to outputs for all of the amplifiers and the outputs have also been placed at the corners of the package (pins 1, 7, 8, and 14).

Precautions should be taken to insure that the power supply for the integrated circuit never becomes reversed in polarity or that the unit is not inadvertently installed backwards in a test socket as an unlimited current surge through the resulting forward diode within the IC could cause fusing of the internal conductors and result in a destroyed unit.

Large differential input voltages can be easily accommodated and, as input differential voltage protection diodes are not needed, no large input currents result from large differential input voltages. The differential input voltage may be larger than V^+ without damaging the device. Protection should be provided to prevent the input voltages from going negative more than $-0.3 V_{DC}$ (at 25°C). An input clamp diode with a resistor to the IC input terminal can be used.

To reduce the power supply drain, the amplifiers have a class A output stage for small signal levels which converts to class B in a large signal mode. This allows the amplifiers to both source and sink large output currents. Therefore both NPN and PNP external current boost transistors can be used to extend the power capability of the basic amplifiers. The output voltage needs to raise approximately 1 diode drop above ground to bias the on-chip vertical PNP transistor for output current sinking applications.

For ac applications, where the load is capacitively coupled to the output of the amplifier, a resistor should be used, from the output of the amplifier to ground to increase the class A bias current and prevent crossover distortion.

Where the load is directly coupled, as in dc applications, there is no crossover distortion.

Capacitive loads which are applied directly to the output of the amplifier reduce the loop stability margin. Values of 50 pF can be accommodated using the worst-case non-inverting unity gain connection. Large closed loop gains or resistive isolation should be used if larger load capacitance must be driven by the amplifier.

The bias network of the LM124 establishes a drain current which is independent of the magnitude of the power supply voltage over the range of from 3 V_{DC} to 30 V_{DC} .

Output short circuits either to ground or to the positive power supply should be of short time duration. Units can be destroyed, not as a result of the short circuit current causing metal fusing, but rather due to the large increase in IC chip dissipation which will cause eventual failure due to excessive junction temperatures. Putting direct short-circuits on more than one amplifier at a time will increase the total IC power dissipation to destructive levels, if not properly protected with external dissipation limiting resistors in series with the output leads of the amplifiers. The larger value of output source current which is available at 25°C provides a larger output current capability at elevated temperatures (see typical performance characteristics) than a standard IC op amp.

The circuits presented in the section on typical applications emphasize operation on only a single power supply voltage. If complementary power supplies are available, all of the standard op amp circuits can be used. In general, introducing a pseudo-ground (a bias voltage reference of $V^+/2$) will allow operation above and below this value in single power supply systems. Many application circuits are shown which take advantage of the wide input common-mode voltage range which includes ground. In most cases, input biasing is not required and input voltages which range to ground can easily be accommodated.

Typical Single-Supply Applications

($V^+ = 5.0 V_{DC}$)

Non-Inverting DC Gain (0V Input = 0V Output)

20108005

*R not needed due to temperature independent I_{IN}

DC Summing Amplifier
 ($V_{IN'S} \geq 0 V_{DC}$ and $V_O \geq V_{DC}$)

20108006

Where: $V_O = V_1 + V_2 - V_3 - V_4$
 ($V_1 + V_2$) \geq ($V_3 + V_4$) to keep $V_O > 0 V_{DC}$

Power Amplifier

20108007

$V_O = 0 V_{DC}$ for $V_{IN} = 0 V_{DC}$
 $A_V = 10$

Typical Single-Supply Applications (V⁺ = 5.0 V_{DC}) (Continued)

LED Driver

20108008

“BI-QUAD” RC Active Bandpass Filter

20108009

f_o = 1 kHz
 Q = 50
 A_v = 100 (40 dB)

Fixed Current Sources

20108010

$$I_2 = \left(\frac{R_1}{R_2}\right) I_1$$

Lamp Driver

20108011

Typical Single-Supply Applications

($V^+ = 5.0 V_{DC}$) (Continued)

20108012

$$V_O = \frac{1V(I_L)}{1A}$$

$$V_L \leq V^+ - 2V$$

*(Increase R1 for I_L small)

20108013

20108014

20108015

20108016

20108017

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

High Compliance Current Sink

20108018

$I_o = 1 \text{ amp/volt } V_{IN}$
 (Increase R_E for I_o small)

Low Drift Peak Detector

20108019

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

Comparator with Hysteresis

Ground Referencing a Differential Input Signal

Voltage Controlled Oscillator Circuit

*Wide control voltage range: $0 V_{DC} \leq V_C \leq 2 (V^+ - 1.5 V_{DC})$

Photo Voltaic-Cell Amplifier

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

AC Coupled Inverting Amplifier

20108024

$$A_V = \frac{R_f}{R_1} \text{ (As shown, } A_V = 10 \text{)}$$

AC Coupled Non-Inverting Amplifier

20108025

$$A_V = 1 + \frac{R_2}{R_1}$$

$$A_V = 11 \text{ (As shown)}$$

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

DC Coupled Low-Pass RC Active Filter

20108026

$f_0 = 1 \text{ kHz}$
 $Q = 1$
 $A_V = 2$

High Input Z, DC Differential Amplifier

20108027

For $\frac{R1}{R2} = \frac{R4}{R3}$ (CMRR depends on this resistor ratio match)

$$V_O = 1 + \frac{R4}{R3} (V_2 - V_1)$$

As shown: $V_O = 2(V_2 - V_1)$

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

High Input Z Adjustable-Gain DC Instrumentation Amplifier

20108028

If $R1 = R5$ & $R3 = R4 = R6 = R7$ (CMRR depends on match)

$$V_O = 1 + \frac{2R1}{R2} (V_2 - V_1)$$

As shown $V_O = 101 (V_2 - V_1)$

Using Symmetrical Amplifiers to Reduce Input Current (General Concept)

20108029

Bridge Current Amplifier

20108030

For $\delta \ll 1$ and $R_f \gg R$

$$V_O \approx V_{REF} \left(\frac{\delta}{2} \right) \frac{R_f}{R}$$

Typical Single-Supply Applications ($V^+ = 5.0 V_{DC}$) (Continued)

Bandpass Active Filter

20108031

$f_0 = 1 \text{ kHz}$
 $Q = 25$

Revision History Section

Date Released	Revision	Section	Originator	Changes
9-2-04	A	New Release, Corporate format	R. Malone	3 MDS data sheets converted into one Corp. data sheet format. MNLM124-X, Rev. 1A2, MNLM124A-X, Rev. 1A3 and MRLM124A-X-RH, Rev. 5A0. MDS data sheets will be archived.
01/27/05	B	Connection Diagrams, Quality Conformance Inspection Section, and Physical Dimensions drawings	R. Malone	Added E package Connection Diagram. Changed verbiage under Quality Conformance Title, and Updated Revisions for the Marketing Drawings.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- | | |
|--|---|
| <p>1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.</p> | <p>2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.</p> |
|--|---|

BANNED SUBSTANCE COMPLIANCE

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
